## Why Choose Collier Arbor Care?

### Local Experience

Since 1937, family owned Collier Arbor Care has provided professional, personalized tree, shrub and lawn care services to the Portland Vancouver area. We understand our local Northwest weather, our soil, the trees and plants that grow here and the problems that afflict them. Over the last 65 years we've had thousands of satisfied and loyal clients who have entrusted their landscapes to our care.

### Committed to Sustainability

A leader in organic-based plant and tree care, we are committed to environmentally-friendly and safe work practices and to providing our customers with the most up-to-date knowledge and techniques in the industry.

Our "Tree Doctors" use our Plant Health Care approach to encourage your plants' natural abilities to ward off problems through regular check-ups, and prescriptive treatments to protect your valuable landscape investment while protecting the environment.

### Knowledge

Our clients and horticultural professionals recognize us for our knowledge, experience, trusted advice and the highest standards of workmanship. From our Board Certified Master Arborist and owner, Terrill Collier to our team of over 12 certified arborists, we bring to your landscape the latest techniques and cutting edge innovations in the fields of tree and lawn care. As your trees, shrubs, and lawns grow healthy, so does our reputation.

### Passion

We love our profession, and we are dedicated to it. We have genuine passion for the trees, lawns and landscapes that have been entrusted to our care. Our passion extends to volunteering in leadership positions on industry boards, local city forestry commissions, supporting local tree planting organizations like Friends of Trees, and raising money for tree research by riding in the week-long Tour des Trees bicycle event.

We also donate our time and labor to maintain The Oldest Apple Tree in the Northwest and one of the largest Oregon White oaks in the country, the Oregon Garden's Signature Oak. Both projects earned us Excellence in Arboriculture awards from Tree Care Industry Association.

# Our Services

## Plant Health Care Programs

Our Plant Health Care program integrates the most holistic and state-of-the-art approach to tree and shrub care — from roots to shoots. This program consists of six to eight scheduled diagnostic inspections of all the ornamental trees and shrubs in your landscape. This enables us to detect and treat problems before they damage your plants. After each inspection we provide you with a written report of our findings and treat your landscape as necessary for harmful insects and diseases. We always suggest and implement solutions that are environmentally friendly.

## Targeted Insect and Disease Treatments

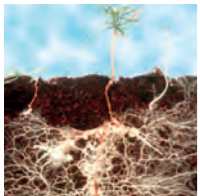

The cure of your plant problems starts with a site visit and an accurate diagnosis by our expert Arborists. Then we custom design an insect and disease treatment program to fit the health needs of your trees (including fruit trees) and shrubs. This scientific approach eliminates unnecessary treatments by targeting only the pest-susceptible plants. By targeting only pest susceptible plants for treatment, we protect the health of your plants and the environment.

## Pruning Trees and Shrubs

Our arborists are balancing plant health, safety and artistry when pruning and shaping your plants from specimen shrubs or prized lace leaf maples to the largest shade and evergreen trees. We prune to emphasize a tree's natural shape. If the tree has structural problems, we can cable it to increase its' safety. In natural disaster situations we provide priority, emergency tree damage response to our clients. We also expertly prune fruit trees to shape and optimize fruit production. All of our work is performed in accordance with Industry Standard (ANSI A-300) tree pruning guidelines.

## Soil Health Programs

Proper nutrition is of primary importance in plant health care. Our Soil Health Programs improve poor soils by promoting healthy soil biology and providing 100% organic plant nutrition. Our programs feature compost tea, organic fertilizers and Mycorrhizae (a beneficial root fungus) to sustainably enhance landscape soils. Our Soil Health Care and Targeted Soil Health Care programs create trees and shrubs that are healthier, more resistant to plant problems, and they look and grow better. If you can do just one thing to promote the health and beauty of your landscape, a Soil Health Program is it!

## Organic Lawn Care

Collier Arbor Care specializes in growing beautiful and healthy Northwest lawns. Our organic based programs provide fertilizers and nutrients based on your particular grass, growing condition, and soil analysis. We apply weed and insect treatments only if they are needed, and offer core aeration to prevent thatch build up and to allow more air, water, and nutrients to get into the root zone. We also provide soil testing and disease treatments.

## Landscape Weed Control

We can apply specialized treatments designed to control existing weeds and deter new weeds from encroaching into your landscape. We treat for weeds four times a year: twice pre-emergent — before they appear — and twice post-emergent — to clean up the few weeds that elude the preventative applications.

## Tree Removal and Stump Grinding

If a tree must be removed because it is dead or hazardous, our expert arborists can safely and efficiently take it down with the most advanced technical rigging equipment and experience in the industry. Our expert and careful tree removal is performed to insure safety to people, structures and the landscape. For stump removal, we have portable stump grinding equipment.

## Consulting and Diagnosis

Collier Arbor Care has developed a reputation within the industry for our expertise in diagnosing tough tree and landscape problems, and for designing and implementing solutions to protect your valuable landscape investment. We perform many consulting and diagnostic services including hazard tree evaluations, insect and disease diagnosis and solutions, tree protection planning and supervision for construction sites, soil analysis and fertilization recommendations, tree surveys, and tree appraisals.
